

# FIWARE Global Summit

## Scale Up for a Real Smart Future

### QuantumLeap

*Storing and querying spatial-temporal IoT data*

[andrea.falconi@martel-innovate.com](mailto:andrea.falconi@martel-innovate.com)

Berlin, Germany  
23-24 October, 2019

# Spatial-temporal features of IoT data

- A reading is taken on Earth at a specific time
- Often to analyse readings in a meaningful way you need:

$$\mathbf{R} = \{ (\mathbf{reading}, \mathbf{when}, \mathbf{where}) \}$$

- QuantumLeap builds persistent and queryable Rs out of NGSI entities

# Example: Monitoring crop growth

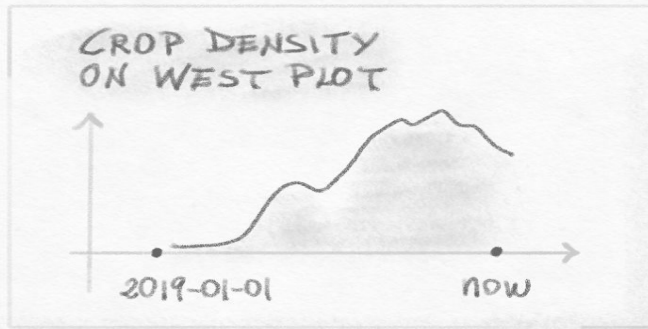

# Example: Monitoring crop growth

- What's the **current** plant count **on** the east plot?
- How has it varied **in** the west plot **since** the beginning of the year?
- Need both **space** and **time** to ask meaningful questions about the data

# QuantumLeap's approach

- Get notified of entity changes by Context Broker
- Convert NGSI entities to tabular format
- Store in time series & geo-spatial DB
- Support multiple DBs
- REST API to query entities over space & time

```

/v2 / types / Drone / attrs / density ?
fromDate = 2019-01-01      $
aggrPeriod = day           $
aggrMethod = sum           $
georel = coveredBy        $
geometry = polygon         $
coords = 0,0; 5,0; 5,5; 0,5; 0,0
  
```

```

id : "urn:watchful:eye:3"
type : "Drone"
density: 35
location: ["0,1", "1,0"] ← geo:box
when : "2019-10-23T14:00:21.238Z"
  
```

2

QUANTUM LEAP

5

```

SELECT SUM(density), ...
WHERE '2019-01-01' ≤ time_index
AND location ⊂ POLYGON((0 0, ...))
GROUP time_index BY day
  
```

CONTEXT BROKER

IOT AGENT LAYER

D | 35 | TLC | 0,1 | BRC | 1,0 |  
W | 2019-10-23T14:00:21.238Z

1

3

entity_id	entity_type	time_index	location	location-centroid	density
urn: ... :3	Device	2019-10 ... 238Z	POLYGON((0 1, 1 0))	POINT(0.5 0.5)	35

TIME SERIES & GEOSPATIAL DB

# RESTful queries: time intervals

`/v2/types/Drone/attrs/density ?`

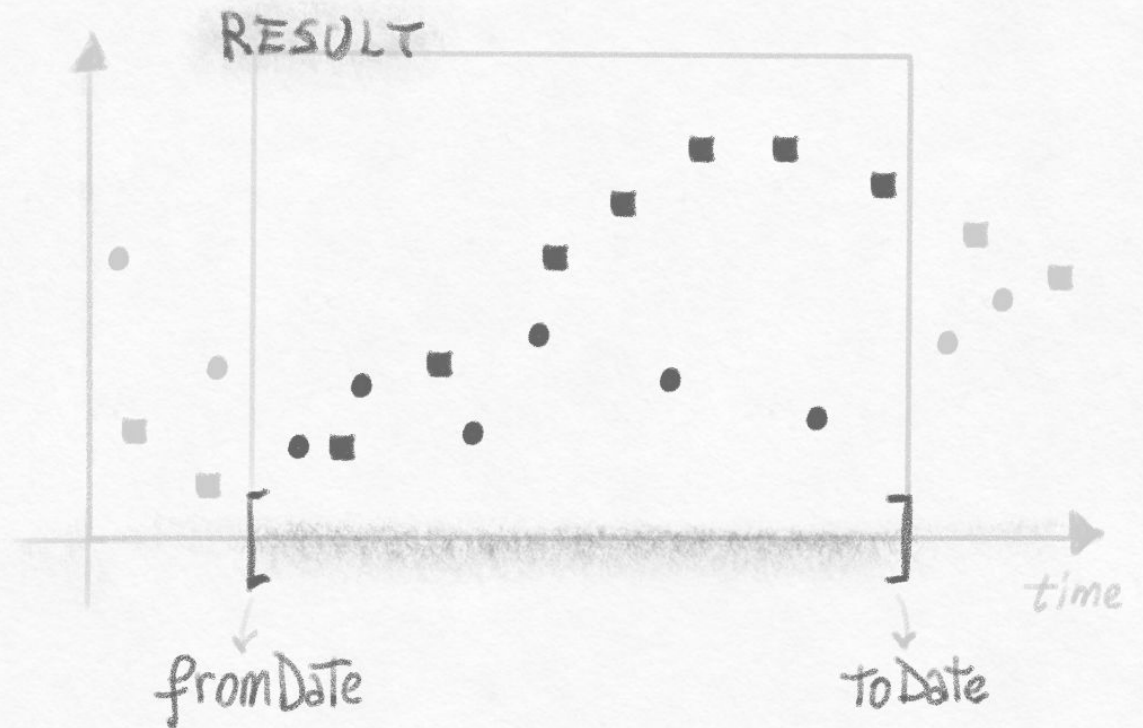

`fromDate = 2019-02-16 &`

`toDate = 2019-10-23`

- density from drone 1
- density from drone 2

density for single entity:

`/v2/entities/urn:drone:1/attrs/density ? ...`

# RESTful queries: time binning

/v2/types/Drone/attrs/density ?

fromDate = 2019-02-16 &

toDate = 2019-10-23 &

aggrPeriod = month &

aggrMethod = count

- density from drone 1
- density from drone 2

density for single entity:

/v2/entities/urn:drone:1/attrs/density ? ...

# RESTful queries: incidence

...? georel = coveredBy \$  
geometry = polygon \$  
coords = 0,0; 5,0; 5,3; 0,3; 0,0

other georel :

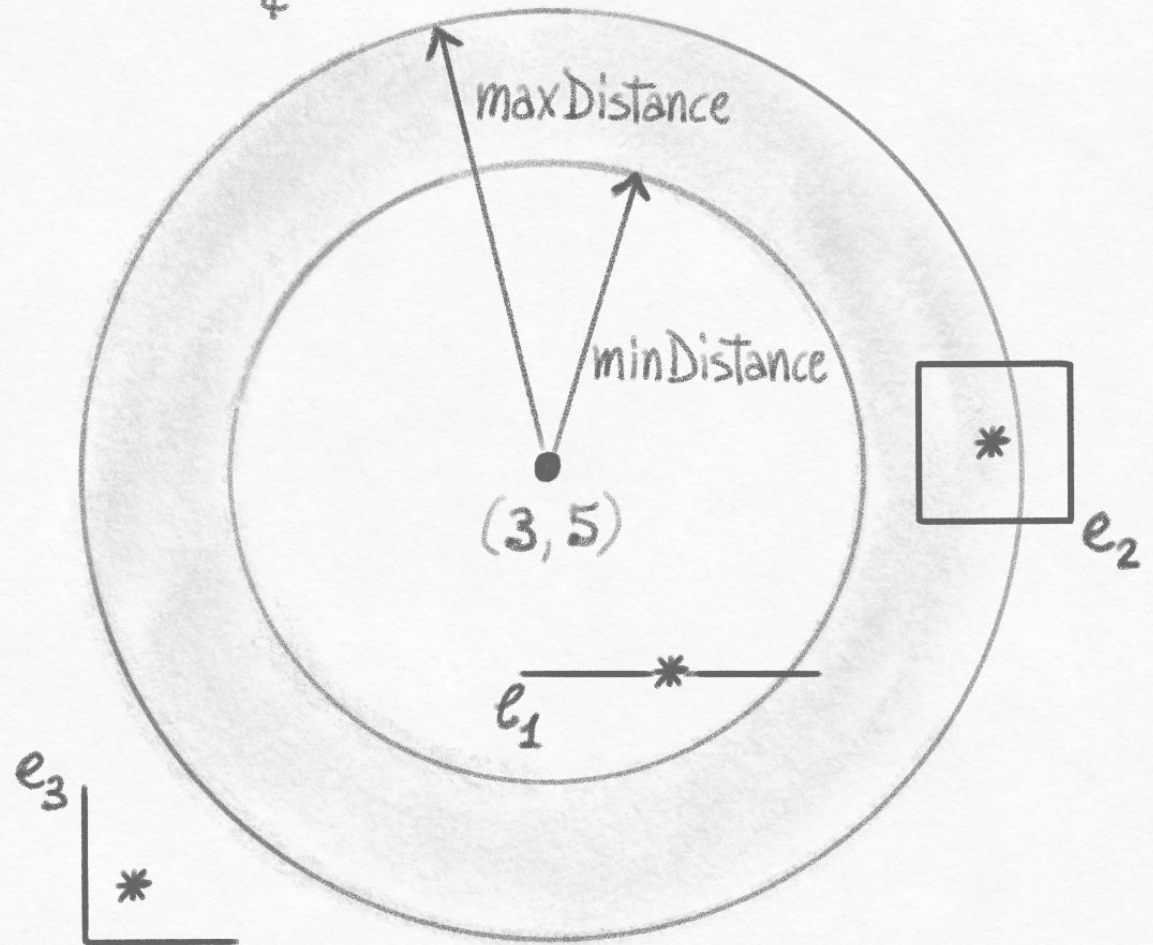

- \* intersects
- \* equals
- \* disjoint

# RESTful queries: radius search

... ? georel = near ; minDistance = 20 ; maxDistance = 30 §  
geometry = point §  
coords = 3,5

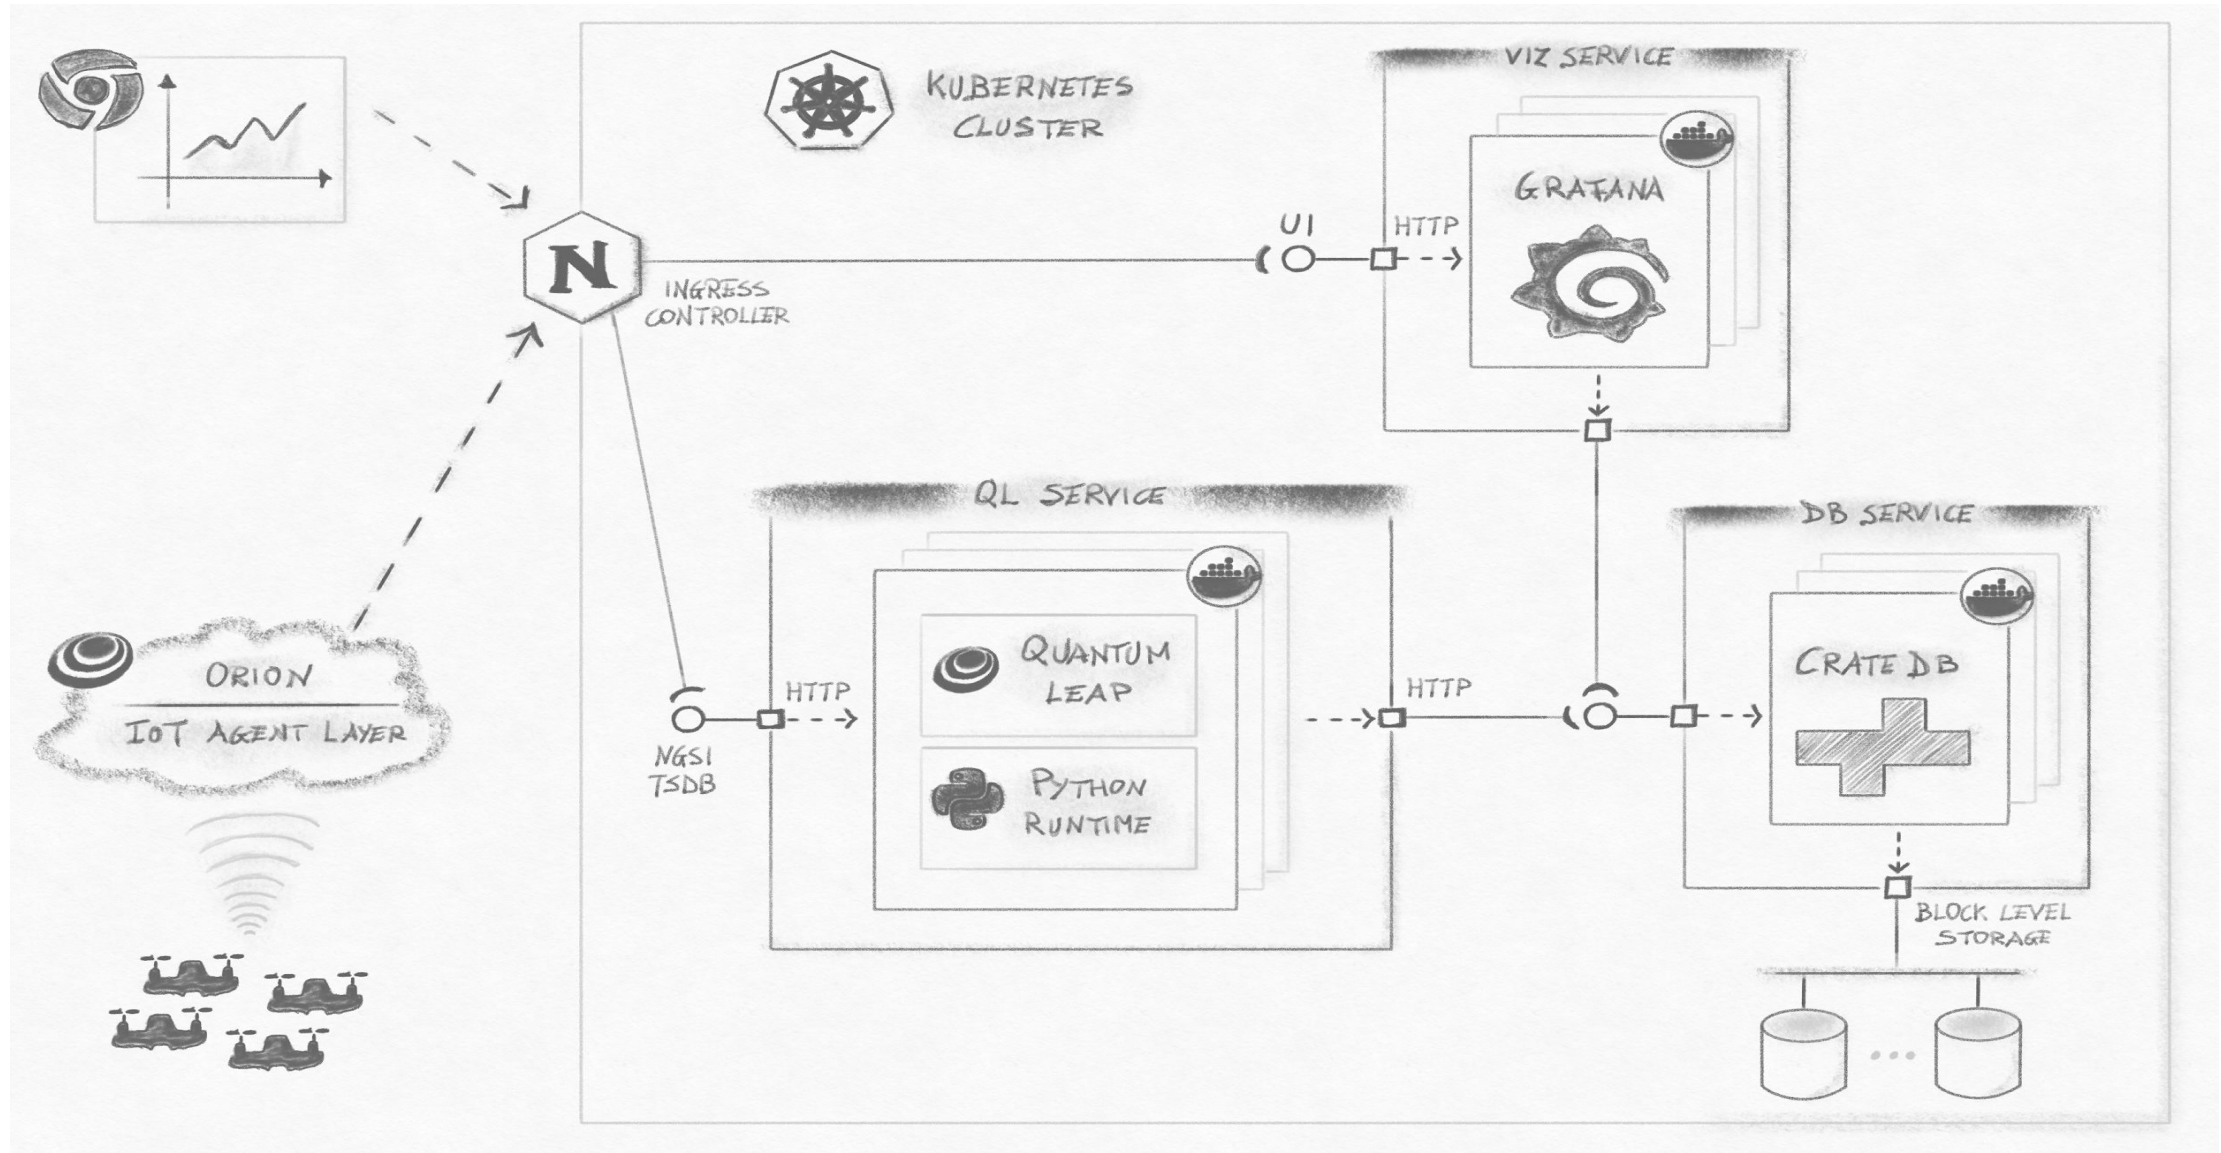

\* centroid

# Ready, steady... deploy!

1. Set up DB: Timescale, CrateDB
2. Deploy Docker image: Compose, Swarm, K8s
3. Create Orion sub for entities to track
4. Set up Grafana: PG data source, map plugin

# Example: K8s cluster deployment

# A few reasons to use QuantumLeap

- Build & query NGSIs v2 time series
- Leverage efficient spatial-temporal DB
- Scale horizontally (stateless)
- Container images, cloud-friendly

# From zero to QuantumLeap hero

1. Take a sip: **FiWare Time-series Data tute**
2. Dive in: **quantumleap.readthedocs.io**
3. Get your fill: **ngsi-timeseries-api** on GitHub
4. Ask questions, we'd love to hear from you :-)
5. Tinker, tweak, develop, open a PR!
